

To create a class `ComputeMethods` that utilizes the `java.util.Random` class, you might want to implement methods that perform various computations or generate random data. Below are some examples of what you can include in this class:

#### Example 1: Generate Random Numbers and Basic Computations

##### 1. Generating Random Integers and Doubles:

- o Methods to generate random integers within a range.
- o Methods to generate random doubles within a range.

##### 2. Computations Using Random Numbers:

- o Methods to compute the sum, average, or other statistics using generated random numbers.

Here's a complete example of the `ComputeMethods` class:

```
import java.util.Random;

public class ComputeMethods {
    private Random random;

    public ComputeMethods() {
        // Initialize the Random object
        random = new Random();
    }

    // Method to generate a random integer between min and max
    // (inclusive)
    public int getRandomInt(int min, int max) {

        return random.nextInt((max - min) + 1) + min;
    }

    // Method to generate a random double between min and max
    public double getRandomDouble(double min, double max) {
        return min + (max - min) * random.nextDouble();
    }
}
```

**// Method to compute the average of an array of integers**

```
public double computeAverage(int[] numbers) {  
    if (numbers.length == 0) return 0;  
    int sum = 0;  
    for (int number : numbers) {  
        sum += number;  
    }  
    return (double) sum / numbers.length;  
}
```

**// Method to compute the sum of an array of doubles**

```
public double computeSum(double[] numbers) {  
    double sum = 0.0;  
    for (double number : numbers) {  
        sum += number;  
    }  
  
    return sum;  
}
```

**// Method to generate an array of random integers**

```
public int[] generateRandomIntArray(int size, int min, int max) {  
    int[] array = new int[size];  
    for (int i = 0; i < size; i++) {  
        array[i] = getRandomInt(min, max);  
    }  
    return array;  
}
```

**// Method to generate an array of random doubles**

```
public double[] generateRandomDoubleArray(int size, double min,  
double max) {
```

```

double[] array = new double[size];
for (int i = 0; i < size; i++) {
    array[i] = getRandomDouble(min, max);
}
return array;
}

public static void main(String[] args) {
    ComputeMethods cm = new ComputeMethods();
    // Generate random numbers and compute results

    int[] intArray = cm.generateRandomIntArray(5, 1, 100);
    double[] doubleArray = cm.generateRandomDoubleArray(5, 0.0,
    1.0);
    System.out.println(""Random Integers:"");
    for (int num : intArray) {
        System.out.print(num + "" ");
    }
    System.out.println(""\nAverage of Integers: " +
    cm.computeAverage(intArray));
    System.out.println(""\nRandom Doubles:"");
    for (double num : doubleArray) {
        System.out.print(num + "" ");
    }
    System.out.println(""\nSum of Doubles: " +
    cm.computeSum(doubleArray));
}
}

import java.util.Random;

public class ComputeMethods {
    private Random random;

```

```

public ComputeMethods() {
    // Initialize the Random object
    random = new Random();
}

// Method to generate a random integer between min and max (inclusive)
public int getRandomInt(int min, int max) {
    return random.nextInt((max - min) + 1) + min;
}

// Method to generate a random double between min and max
public double getRandomDouble(double min, double max) {
    return min + (max - min) * random.nextDouble();
}

// Method to compute the average of an array of integers
public double computeAverage(int[] numbers) {
    if (numbers.length == 0) return 0;
    int sum = 0;
    for (int number : numbers) {
        sum += number;
    }
    return (double) sum / numbers.length;
}

// Method to compute the sum of an array of doubles
public double computeSum(double[] numbers) {
    double sum = 0.0;
    for (double number : numbers) {
        sum += number;
    }
}

```

```
    }  
    return sum;  
}
```

```
// Method to generate an array of random integers  
public int[] generateRandomIntArray(int size, int min, int max) {  
    int[] array = new int[size];  
    for (int i = 0; i < size; i++) {  
        array[i] = getRandomInt(min, max);  
    }  
    return array;  
}
```

```
// Method to generate an array of random doubles  
public double[] generateRandomDoubleArray(int size, double min, double max) {  
    double[] array = new double[size];  
    for (int i = 0; i < size; i++) {  
        array[i] = getRandomDouble(min, max);  
    }  
    return array;  
}
```

```
public static void main(String[] args) {  
    ComputeMethods cm = new ComputeMethods();  
    // Generate random numbers and compute results  
  
    int[] intArray = cm.generateRandomIntArray(5, 1, 100);  
    double[] doubleArray = cm.generateRandomDoubleArray(5, 0.0, 1.0);  
  
    System.out.println("Random Integers:");  
    for (int num : intArray) {
```

```

        System.out.print(num + " ");
    }

    System.out.println("\nAverage of Integers: " + cm.computeAverage(intArray));

    System.out.println("\nRandom Doubles:");
    for (double num : doubleArray) {
        System.out.print(num + " ");
    }

    System.out.println("\nSum of Doubles: " + cm.computeSum(doubleArray));
}
}

```

Output

```

java -cp /tmp/snFsry7eBq/ComputeMethods
Random Integers:
47 99 18 31 14
Average of Integers: 41.8

Random Doubles:
0.3805020514978509 0.41616890451132593 0.31123268663353076 0.636905107413056 0.9748255597436779
Sum of Doubles: 2.7196343097994413

=== Code Execution Successful ===
